

KnowledgePresenter

Develop fully interactive and accurate software simulations for training and/or testing.

KnowledgePresenter® X provides a range of tools and techniques that make creating software simulations a breeze.

From still and movie screen capture, automated event creation and scoring, to incredible compression—no plugins required.

Feature	Benefit
Still Screen Capture	Capture a series of screens in seconds. Set mouseover and mousedown images. Save images in one operation. Capture from full screen, selected window, or selected region.
Automated Screen Shot Import	Import screen shots, and have mousedown and mouseover images assigned automatically—with automated event, hotspot and scoring creation.
High Quality Resampling	No matter what size screen shots were originally taken at, use them in KP, and KP will bicubically resample and sharpen during export.
Spatial Compression	When exporting, use the Spatial Compression feature to create vastly smaller file sizes and download times.
Color and Redundancy Compression	Benefit from a variety of other compression methods, such as optional color reduction (with choice of palette, or automatic), redundant and duplicated file scanning.
Work with Full Screen Shots	No need to chop up screen shots manually—work with full screen shots, so everything is aligned automatically. KnowledgePresenter automatically chops up and removed redundant or unnecessary image areas.
Templates	Select from a range of templates predesigned for software simulations.
Arrows	Insert customizable directional arrows on screen in seconds.
Instruction Text Boxes	Create instruction text with a standard, user definable style—allows you to change the appearance of all text in one operation.
Interaction	Detect and respond to your choice of user mouse movements, mousedowns, mouseups, key presses, drag and drops, entry of strings, etc. Combine any interaction with operators such as the Shift or Control keys, or the right mouse button.
Multimedia	Optionally add audio or video to any step.
User Errors	Automatically track user errors.
Timeouts	Apply time limits to individual operations or the entire lesson.
High Quality Playback	Simulations are more professional and accurate, users are not frustrated - activities operate the way you designed them.
Group interactions together to form an objective	Provides detailed results on a per objective basis—including scores, times, and errors.
Include multiple checks for the one event.	Provide much more accurate simulations. Allow users to use the mouse, keyboard, menu command, or toolbar buttons
Screen Movie Capture	Capture screen movies at up to 20 frames per second in full color—and save them as Windows Media Files, Animated GIFs, or as Flash files.
Customizable Feedback	You determine whether and what sort of feedback to give when users get interactions wrong or right, including whether they get to try it again.
Import Scripts from Microsoft Word	Import scripts directly from Microsoft Word files, and have them flow into instructional text boxes automatically.
